# Package 'ellmer'

January 9, 2025

Title Chat with Large Language Models

Version 0.1.0

**Description** Chat with large language models from a range of providers including 'Claude' <<u>https://claude.ai</u>>, 'OpenAI' <<u>https://chatgpt.com</u>>, and more. Supports streaming, asynchronous calls, tool calling, and structured data extraction.

## Chat

## Description

A Chat is an sequence of sequence of user and assistant Turns sent to a specific Provider. A Chat is a mutable R6 object that takes care of managing the state associated with the chat; i.e. it records the messages that you send to the server, and the messages that you receive back. If you register a tool (i.e. an R function that the assistant can call on your behalf), it also takes care of the tool loop.

You should generally not create this object yourself, but instead call chat\_openai() or friends instead.

#### Value

A Chat object

#### Methods

**Public methods:** 

- Chat\$new()
- Chat\$get\_turns()
- Chat\$set\_turns()
- Chat\$get\_system\_prompt()
- Chat\$set\_system\_prompt()
- Chat\$tokens()
- Chat\$last\_turn()
- Chat\$chat()
- Chat\$extract\_data()
- Chat\$extract\_data\_async()
- Chat\$chat\_async()
- Chat\$stream()
- Chat\$stream\_async()
- Chat\$register\_tool()
- Chat\$clone()

#### Method new():

Usage:

Chat\$new(provider, turns, seed = NULL, echo = "none")

Arguments:

provider A provider object.

turns An unnamed list of turns to start the chat with (i.e., continuing a previous conversation). If NULL or zero-length list, the conversation begins from scratch.

seed Optional integer seed that ChatGPT uses to try and make output more reproducible.

echo One of the following options:

- none: don't emit any output (default when running in a function).
- text: echo text output as it streams in (default when running at the console).
- all: echo all input and output.

Note this only affects the chat() method.

**Method** get\_turns(): Retrieve the turns that have been sent and received so far (optionally starting with the system prompt, if any).

```
Usage:
Chat$get_turns(include_system_prompt = FALSE)
```

Arguments:

include\_system\_prompt Whether to include the system prompt in the turns (if any exists).

Method set\_turns(): Replace existing turns with a new list.

Usage: Chat\$set\_turns(value) Arguments: value A list of Turns.

Method get\_system\_prompt(): If set, the system prompt, it not, NULL.

Usage: Chat\$get\_system\_prompt()

Method set\_system\_prompt(): Update the system prompt

Usage: Chat\$set\_system\_prompt(value)

Arguments:

value A string giving the new system prompt

**Method** tokens(): List the number of tokens consumed by each assistant turn. Currently tokens are recorded for assistant turns only; so user turns will have zeros.

Usage: Chat\$tokens()

**Method** last\_turn(): The last turn returned by the assistant.

```
Usage:
Chat$last_turn(role = c("assistant", "user", "system"))
Arguments:
role Optionally, specify a role to find the last turn with for the role.
Returns: Either a Turn or NULL, if no turns with the specified role have occurred.
```

**Method** chat(): Submit input to the chatbot, and return the response as a simple string (probably Markdown).

Usage:

Chat\$chat(..., echo = NULL)

Arguments:

- ... The input to send to the chatbot. Can be strings or images (see content\_image\_file() and content\_image\_url().
- echo Whether to emit the response to stdout as it is received. If NULL, then the value of echo set when the chat object was created will be used.

Method extract\_data(): Extract structured data

Usage:

```
Chat$extract_data(..., type, echo = "none", convert = TRUE)
```

Arguments:

... The input to send to the chatbot. Will typically include the phrase "extract structured data".

type A type specification for the extracted data. Should be created with a type\_() function.

- echo Whether to emit the response to stdout as it is received. Set to "text" to stream JSON data as it's generated (not supported by all providers).
- convert Automatically convert from JSON lists to R data types using the schema. For example, this will turn arrays of objects into data frames and arrays of strings into a character vector.

**Method** extract\_data\_async(): Extract structured data, asynchronously. Returns a promise that resolves to an object matching the type specification.

Usage:

```
Chat$extract_data_async(..., type, echo = "none")
```

Arguments:

- ... The input to send to the chatbot. Will typically include the phrase "extract structured data".
- type A type specification for the extracted data. Should be created with a type\_() function.
- echo Whether to emit the response to stdout as it is received. Set to "text" to stream JSON data as it's generated (not supported by all providers).

**Method** chat\_async(): Submit input to the chatbot, and receive a promise that resolves with the response all at once. Returns a promise that resolves to a string (probably Markdown).

Usage:

Chat\$chat\_async(...)

Arguments:

... The input to send to the chatbot. Can be strings or images.

**Method** stream(): Submit input to the chatbot, returning streaming results. Returns A coro generator that yields strings. While iterating, the generator will block while waiting for more content from the chatbot.

Usage:

Chat\$stream(...)

Arguments:

... The input to send to the chatbot. Can be strings or images.

Chat

**Method** stream\_async(): Submit input to the chatbot, returning asynchronously streaming results. Returns a coro async generator that yields string promises.

Usage: Chat\$stream\_async(...)

Arguments:

... The input to send to the chatbot. Can be strings or images.

**Method** register\_tool(): Register a tool (an R function) that the chatbot can use. If the chatbot decides to use the function, ellmer will automatically call it and submit the results back.

The return value of the function. Generally, this should either be a string, or a JSON-serializable value. If you must have more direct control of the structure of the JSON that's returned, you can return a JSON-serializable value wrapped in base::I(), which ellmer will leave alone until the entire request is JSON-serialized.

Usage: Chat\$register\_tool(tool\_def)

Arguments:

tool\_def Tool definition created by tool().

Method clone(): The objects of this class are cloneable with this method.

Usage:

Chat\$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

#### Examples

chat <- chat\_openai(echo = TRUE)
chat\$chat("Tell me a funny joke")</pre>

chat\_azure

Chat with a model hosted on Azure OpenAI

#### Description

The Azure OpenAI server hosts a number of open source models as well as proprietary models from OpenAI.

## chat\_azure

# Usage

```
chat_azure(
   endpoint = azure_endpoint(),
   deployment_id,
   api_version = NULL,
   system_prompt = NULL,
   turns = NULL,
   api_key = azure_key(),
   token = NULL,
   api_args = list(),
   echo = c("none", "text", "all")
)
```

## Arguments

endpoint	Azure OpenAI endpoint url with protocol and hostname, i.e. https://{your-resource-name}.openai. Defaults to using the value of the AZURE_OPENAI_ENDPOINT envinronment vari- able.
deployment_id	Deployment id for the model you want to use.
api_version	The API version to use.
system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the AZURE_OPENAI_API_KEY environment variable.
token	Azure token for authentication. This is typically not required for Azure OpenAI API calls, but can be used if your setup requires it.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.
	Note this only affects the chat() method.

## Value

A Chat object.

# Examples

```
## Not run:
chat <- chat_azure(deployment_id = "gpt-4o-mini")
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

```
chat_bedrock
```

## Description

AWS Bedrock provides a number of chat based models, including those Anthropic's Claude.

Authenthication is handled through {paws.common}, so if authenthication does not work for you automatically, you'll need to follow the advice at https://www.paws-r-sdk.com/#credentials. In particular, if your org uses AWS SSO, you'll need to run aws sso login at the terminal.

#### Usage

```
chat_bedrock(
  system_prompt = NULL,
  turns = NULL,
  model = NULL,
  profile = NULL,
  echo = NULL
)
```

## Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
profile	AWS profile to use.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.

Note this only affects the chat() method.

# Value

A Chat object.

chat_groq(), chat_ollama(), chat_openai(), chat_perplexity()
```

## chat\_claude

#### Examples

```
## Not run:
chat <- chat_bedrock()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

chat\_claude

Chat with an Anthropic Claude model

## Description

Anthropic provides a number of chat based models under the Claude moniker. Note that a Claude Pro membership does not give you the ability to call models via the API; instead, you will need to sign up (and pay for) a developer account

To authenticate, we recommend saving your API key to the ANTHROPIC\_API\_KEY env var in your .Renviron (which you can easily edit by calling usethis::edit\_r\_environ()).

#### Usage

```
chat_claude(
  system_prompt = NULL,
  turns = NULL,
  max_tokens = 4096,
  model = NULL,
  api_args = list(),
  base_url = "https://api.anthropic.com/v1",
  api_key = anthropic_key(),
  echo = NULL
)
```

#### Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
max_tokens	Maximum number of tokens to generate before stopping.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
base_url	The base URL to the endpoint; the default uses OpenAI.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the ANTHROPIC_API_KEY environment variable.

echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.

Note this only affects the chat() method.

#### Value

A Chat object.

#### See Also

```
Other chatbots: chat_bedrock(), chat_cortex(), chat_databricks(), chat_gemini(), chat_github(),
chat_groq(), chat_ollama(), chat_openai(), chat_perplexity()
```

#### Examples

```
chat <- chat_claude()
chat$chat("Tell me three jokes about statisticians")</pre>
```

chat\_cortex

Create a chatbot that speaks to the Snowflake Cortex Analyst

#### Description

Chat with the LLM-powered Snowflake Cortex Analyst.

Unlike most comparable model APIs, Cortex does not take a system prompt. Instead, the caller must provide a "semantic model" describing available tables, their meaning, and verified queries that can be run against them as a starting point. The semantic model can be passed as a YAML string or via reference to an existing file in a Snowflake Stage.

Note that Cortex does not support multi-turn, so it will not remember previous messages. Nor does it support registering tools, and attempting to do so will result in an error.

#### Authentication:

chat\_cortex() picks up the following ambient Snowflake credentials:

- A static OAuth token defined via the SNOWFLAKE\_TOKEN environment variable.
- Key-pair authentication credentials defined via the SNOWFLAKE\_USER and SNOWFLAKE\_PRIVATE\_KEY (which can be a PEM-encoded private key or a path to one) environment variables.
- Posit Workbench-managed Snowflake credentials for the corresponding account.

chat\_cortex

# Usage

```
chat_cortex(
    account = Sys.getenv("SNOWFLAKE_ACCOUNT"),
    credentials = NULL,
    model_spec = NULL,
    model_file = NULL,
    api_args = list(),
    echo = c("none", "text", "all")
)
```

# Arguments

account	A Snowflake account identifier, e.g. "testorg-test_account".
credentials	A list of authentication headers to pass into httr2::req_headers(), a function that returns them when passed account as a parameter, or NULL to use ambient credentials.
model_spec	A semantic model specification, or NULL when using model_file instead.
model_file	Path to a semantic model file stored in a Snowflake Stage, or NULL when using model_spec instead.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	<ul> <li>none: don't emit any output (default when running in a function).</li> <li>text: echo text output as it streams in (default when running at the console).</li> <li>all: echo all input and output.</li> </ul>

Note this only affects the chat() method.

## Value

A Chat object.

# See Also

```
Other chatbots: chat_bedrock(), chat_claude(), chat_databricks(), chat_gemini(), chat_github(),
chat_groq(), chat_ollama(), chat_openai(), chat_perplexity()
```

## Examples

```
chat <- chat_cortex(
   model_file = "@my_db.my_schema.my_stage/model.yaml"
)
chat$chat("What questions can I ask?")</pre>
```

```
chat_databricks
```

#### Description

Databricks provides out-of-the-box access to a number of foundation models and can also serve as a gateway for external models hosted by a third party.

Databricks models do not support images, but they do support structured outputs. Tool calling support is also very limited at present; too limited for ellmer's tool calling features to work properly at all.

### Authentication:

chat\_databricks() picks up on ambient Databricks credentials for a subset of the Databricks client unified authentication model. Specifically, it supports:

- · Personal access tokens
- Service principals via OAuth (OAuth M2M)
- User account via OAuth (OAuth U2M)
- · Authentication via the Databricks CLI
- · Posit Workbench-managed credentials

#### Usage

```
chat_databricks(
  workspace = databricks_workspace(),
  system_prompt = NULL,
  turns = NULL,
  model = NULL,
  token = NULL,
  api_args = list(),
  echo = c("none", "text", "all")
)
```

#### Arguments

workspace	The URL of a Databricks workspace, e.g. "https://example.cloud.databricks.com". Will use the value of the environment variable DATABRICKS_HOST, if set.
system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use. Available foundational models include:
	• databricks-dbrx-instruct (the default)

• databricks-mixtral-8x7b-instruct

## chat\_gemini

	<ul> <li>databricks-meta-llama-3-1-70b-instruct</li> </ul>
	<ul> <li>databricks-meta-llama-3-1-405b-instruct</li> </ul>
token	An authentication token for the Databricks workspace, or NULL to use ambient credentials.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	<ul> <li>none: don't emit any output (default when running in a function).</li> <li>text: echo text output as it streams in (default when running at the console).</li> </ul>
	• all: echo all input and output.
	Note this only affects the chat() method.

# Value

A Chat object.

## See Also

```
Other chatbots: chat_bedrock(), chat_claude(), chat_cortex(), chat_gemini(), chat_github(),
chat_groq(), chat_ollama(), chat_openai(), chat_perplexity()
```

#### Examples

```
## Not run:
chat <- chat_databricks()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

chat\_gemini

Chat with a Google Gemini model

#### Description

To authenticate, we recommend saving your API key to the GOOGLE\_API\_KEY env var in your .Renviron (which you can easily edit by calling usethis::edit\_r\_environ()).

# Usage

```
chat_gemini(
  system_prompt = NULL,
  turns = NULL,
  base_url = "https://generativelanguage.googleapis.com/v1beta/",
  api_key = gemini_key(),
  model = NULL,
```

```
api_args = list(),
echo = NULL
)
```

# Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
base_url	The base URL to the endpoint; the default uses OpenAI.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the GOOGLE_API_KEY environment variable.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.
	Note this only affects the chat() method.

# Value

A Chat object.

# See Also

```
Other chatbots: chat_bedrock(), chat_claude(), chat_cortex(), chat_databricks(), chat_github(),
chat_groq(), chat_ollama(), chat_openai(), chat_perplexity()
```

## Examples

```
## Not run:
chat <- chat_gemini()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

chat\_github

## Description

GitHub (via Azure) hosts a number of open source and OpenAI models. To access the GitHub model marketplace, you will need to apply for and be accepted into the beta access program. See https://github.com/marketplace/models for details.

This function is a lightweight wrapper around chat\_openai() with the defaults tweaked for the GitHub model marketplace.

## Usage

```
chat_github(
  system_prompt = NULL,
  turns = NULL,
  base_url = "https://models.inference.ai.azure.com/",
  api_key = github_key(),
  model = NULL,
  seed = NULL,
  api_args = list(),
  echo = NULL
)
```

#### Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
base_url	The base URL to the endpoint; the default uses OpenAI.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead manage your GitHub credentials as described in https://usethis.r-lib.org/articles/git-credentials.html. For headless environments, this will also look in the GITHUB_PAT env var.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
seed	Optional integer seed that ChatGPT uses to try and make output more reproducible.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).

- text: echo text output as it streams in (default when running at the console).
- all: echo all input and output.

Note this only affects the chat() method.

#### Value

A Chat object.

# See Also

Other chatbots: chat\_bedrock(), chat\_claude(), chat\_cortex(), chat\_databricks(), chat\_gemini(), chat\_groq(), chat\_ollama(), chat\_openai(), chat\_perplexity()

## Examples

```
## Not run:
chat <- chat_github()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

chat\_groq

Chat with a model hosted on Groq

#### Description

Sign up at https://groq.com.

This function is a lightweight wrapper around chat\_openai() with the defaults tweaked for groq.

It does not currently support structured data extraction.

## Usage

```
chat_groq(
  system_prompt = NULL,
  turns = NULL,
  base_url = "https://api.groq.com/openai/v1",
  api_key = groq_key(),
  model = NULL,
  seed = NULL,
  api_args = list(),
  echo = NULL
)
```

## chat\_groq

## Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
base_url	The base URL to the endpoint; the default uses OpenAI.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the OPENAI_API_KEY environment variable.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
seed	Optional integer seed that ChatGPT uses to try and make output more repro- ducible.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.

Note this only affects the chat() method.

# Value

A Chat object.

# See Also

```
Other chatbots: chat_bedrock(), chat_claude(), chat_cortex(), chat_databricks(), chat_gemini(),
chat_github(), chat_ollama(), chat_openai(), chat_perplexity()
```

## Examples

```
## Not run:
chat <- chat_groq()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

```
chat_ollama
```

## Description

To use chat\_ollama() first download and install Ollama. Then install some models from the command line, e.g. with ollama pull llama3.1 or ollama pull gemma2.

This function is a lightweight wrapper around chat\_openai() with the defaults tweaked for ollama.

## **Known limitations:**

- Tool calling is not supported with streaming (i.e. when echo is "text" or "all")
- Tool calling generally seems quite weak, at least with the models I have tried it with.

# Usage

```
chat_ollama(
  system_prompt = NULL,
  turns = NULL,
  base_url = "http://localhost:11434",
  model,
  seed = NULL,
  api_args = list(),
  echo = NULL
)
```

## Arguments

system prompt to set the behavior of the assistant.
list of Turns to start the chat with (i.e., continuing a previous conversation). If ot provided, the conversation begins from scratch.
he base URL to the endpoint; the default uses OpenAI.
ne model to use for the chat. The default, NULL, will pick a reasonable default, id tell you about. We strongly recommend explicitly choosing a model for all it the most casual use.
ptional integer seed that ChatGPT uses to try and make output more repro- icible.
amed list of arbitrary extra arguments appended to the body of every chat API ll.
ne of the following options:
<ul> <li>none: don't emit any output (default when running in a function).</li> <li>text: echo text output as it streams in (default when running at the console).</li> </ul>
• all: echo all input and output.

Note this only affects the chat() method.

#### chat\_openai

```

## End(Not run)

chat\_openai

Chat with an OpenAI model

# Description

OpenAI provides a number of chat-based models, mostly under the ChatGPT brand. Note that a ChatGPT Plus membership does not grant access to the API. You will need to sign up for a developer account (and pay for it) at the developer platform.

For authentication, we recommend saving your API key to the OPENAI\_API\_KEY environment variable in your .Renviron file. You can easily edit this file by calling usethis::edit\_r\_environ().

#### Usage

```
chat_openai(
  system_prompt = NULL,
  turns = NULL,
  base_url = "https://api.openai.com/v1",
  api_key = openai_key(),
  model = NULL,
  seed = NULL,
  api_args = list(),
  echo = c("none", "text", "all")
)
```

#### Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
base_url	The base URL to the endpoint; the default uses OpenAI.

api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the OPENAI_API_KEY environment variable.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
seed	Optional integer seed that ChatGPT uses to try and make output more reproducible.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.

Note this only affects the chat() method.

## Value

A Chat object.

## See Also

Other chatbots: chat\_bedrock(), chat\_claude(), chat\_cortex(), chat\_databricks(), chat\_gemini(), chat\_github(), chat\_groq(), chat\_ollama(), chat\_perplexity()

#### Examples

```
chat <- chat_openai()
chat$chat("
    What is the difference between a tibble and a data frame?
    Answer with a bulleted list
")</pre>
```

chat\$chat("Tell me three funny jokes about statistcians")

chat\_perplexity Chat with a model hosted on perplexity.ai

#### Description

Sign up at https://www.perplexity.ai.

Perplexity AI is a platform for running LLMs that are capable of searching the web in real-time to help them answer questions with information that may not have been available when the model was trained.

This function is a lightweight wrapper around chat\_openai() with the defaults tweaked for Perplexity AI.

## chat\_perplexity

# Usage

```
chat_perplexity(
  system_prompt = NULL,
  turns = NULL,
  base_url = "https://api.perplexity.ai/",
  api_key = perplexity_key(),
  model = NULL,
  seed = NULL,
  api_args = list(),
  echo = NULL
)
```

# Arguments

system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
base_url	The base URL to the endpoint; the default uses OpenAI.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the PERPLEXITY_API_KEY environment variable.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
seed	Optional integer seed that ChatGPT uses to try and make output more reproducible.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
echo	One of the following options:
	• none: don't emit any output (default when running in a function).
	• text: echo text output as it streams in (default when running at the con- sole).
	• all: echo all input and output.

Note this only affects the chat() method.

## Value

A Chat object.

## See Also

```
Other chatbots: chat_bedrock(), chat_claude(), chat_cortex(), chat_databricks(), chat_gemini(),
chat_github(), chat_groq(), chat_ollama(), chat_openai()
```

# Examples

```
## Not run:
chat <- chat_perplexity()
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

chat\_vllm

Chat with a model hosted by vLLM

# Description

vLLM is an open source library that provides an efficient and convenient LLMs model server. You can use chat\_vllm() to connect to endpoints powered by vLLM.

## Usage

```
chat_vllm(
   base_url,
   system_prompt = NULL,
   turns = NULL,
   model,
   seed = NULL,
   api_args = list(),
   api_key = vllm_key(),
   echo = NULL
)
```

## Arguments

base_url	The base URL to the endpoint; the default uses OpenAI.
system_prompt	A system prompt to set the behavior of the assistant.
turns	A list of Turns to start the chat with (i.e., continuing a previous conversation). If not provided, the conversation begins from scratch.
model	The model to use for the chat. The default, NULL, will pick a reasonable default, and tell you about. We strongly recommend explicitly choosing a model for all but the most casual use.
seed	Optional integer seed that ChatGPT uses to try and make output more reproducible.
api_args	Named list of arbitrary extra arguments appended to the body of every chat API call.
api_key	The API key to use for authentication. You generally should not supply this directly, but instead set the VLLM_API_KEY environment variable.
echo	One of the following options:

22

## Content

- none: don't emit any output (default when running in a function).
- text: echo text output as it streams in (default when running at the console).
- all: echo all input and output.

Note this only affects the chat() method.

# Value

A Chat object.

#### Examples

```
## Not run:
chat <- chat_vllm("http://my-vllm.com")
chat$chat("Tell me three jokes about statisticians")
```

## End(Not run)

```
Content
```

Content types received from and sent to a chatbot

#### Description

Use these functions if you're writing a package that extends ellmer and need to customise methods for various types of content. For normal use, see content\_image\_url() and friends.

ellmer abstracts away differences in the way that different Providers represent various types of content, allowing you to more easily write code that works with any chatbot. This set of classes represents types of content that can be either sent to and received from a provider:

- ContentText: simple text (often in markdown format). This is the only type of content that can be streamed live as it's received.
- ContentImageRemote and ContentImageInline: images, either as a pointer to a remote URL or included inline in the object. See content\_image\_file() and friends for convenient ways to construct these objects.
- ContentToolRequest: a request to perform a tool call (sent by the assistant).
- ContentToolResult: the result of calling the tool (sent by the user).

#### Usage

```
Content()
```

```
ContentText(text = stop("Required"))
```

ContentImage()

```
ContentImageRemote(url = stop("Required"), detail = "")
```

```
ContentImageInline(type = stop("Required"), data = NULL)
ContentToolRequest(
   id = stop("Required"),
   name = stop("Required"),
   arguments = list()
)
```

ContentToolResult(id = stop("Required"), value = NULL, error = NULL)

#### Arguments

text	A single string.
url	URL to a remote image.
detail	Not currently used.
type	MIME type of the image.
data	Base64 encoded image data.
id	Tool call id (used to associate a request and a result)
name	Function name
arguments	Named list of arguments to call the function with.
value, error	Either the results of calling the function if it succeeded, otherwise the error message, as a string. One of value and error will always be NULL.

## Value

S7 objects that all inherit from Content

## Examples

```
Content()
ContentText("Tell me a joke")
ContentImageRemote("https://www.r-project.org/Rlogo.png")
ContentToolRequest(id = "abc", name = "mean", arguments = list(x = 1:5))
```

contents\_text Format contents into a textual representation

#### Description

These generic functions can be use to convert Turn contents or Content objects into textual representations.

- contents\_text() is the most minimal and only includes ContentText objects in the output.
- contents\_markdown() returns the text content (which it assumes to be markdown and does not convert it) plus markdown representations of images and other content types.
- contents\_html() returns the text content, converted from markdown to HTML with commonmark::markdown\_html() plus HTML representations of images and other content types.

## content\_image\_url

#### Usage

```
contents_text(content, ...)
contents_html(content, ...)
contents_markdown(content, ...)
```

#### Arguments

content	The Turn or Content object to be converted into text. contents_markdown() also accepts Chat instances to turn the entire conversation history into markdown text.
	Additional arguments passed to methods.

#### Value

A string of text, markdown or HTML.

#### Examples

```
turns <- list(
  Turn("user", contents = list(
    ContentText("What's this image?"),
    content_image_url("https://placehold.co/200x200")
  )),
  Turn("assistant", "It's a placeholder image.")
)
lapply(turns, contents_text)
lapply(turns, contents_markdown)
if (rlang::is_installed("commonmark")) {
    contents_html(turns[[1]])
}
```

content\_image\_url Encode image content for chat input

# Description

These functions are used to prepare image URLs and files for input to the chatbot. The content\_image\_url() function is used to provide a URL to an image, while content\_image\_file() is used to provide the image data itself.

```
content_image_url(url, detail = c("auto", "low", "high"))
```

```
content_image_file(path, content_type = "auto", resize = "low")
```

```
content_image_plot(width = 768, height = 768)
```

## Arguments

url	The URL of the image to include in the chat input. Can be a data: URL or a regular URL. Valid image types are PNG, JPEG, WebP, and non-animated GIF.
detail	The detail setting for this image. Can be "auto", "low", or "high".
path	The path to the image file to include in the chat input. Valid file extensions are .png, .jpeg, .jpg, .webp, and (non-animated) .gif.
content_type	The content type of the image (e.g. image/png). If "auto", the content type is inferred from the file extension.
resize	If "low", resize images to fit within 512x512. If "high", resize to fit within 2000x768 or 768x2000. (See the OpenAI docs for more on why these specific sizes are used.) If "none", do not resize.
	You can also pass a custom string to resize the image to a specific size, e.g. "200x200" to resize to 200x200 pixels while preserving aspect ratio. Append > to resize only if the image is larger than the specified size, and ! to ignore aspect ratio (e.g. "300x200>!").
	All values other than none require the magick package.
width, height	Width and height in pixels.

## Value

An input object suitable for including in the ... parameter of the chat(), stream(), chat\_async(), or stream\_async() methods.

## Examples

```
chat <- chat_openai(echo = TRUE)
chat$chat(
    "What do you see in these images?",
    content_image_url("https://www.r-project.org/Rlogo.png"),
    content_image_file(system.file("httr2.png", package = "ellmer"))
)

plot(waiting ~ eruptions, data = faithful)
chat <- chat_openai(echo = TRUE)
chat$chat(
    "Describe this plot in one paragraph, as suitable for inclusion in
    alt-text. You should briefly describe the plot type, the axes, and
    2-5 major visual patterns.",
    content_image_plot()</pre>
```

create\_tool\_def Ca

Create metadata for a tool

#### Description

In order to use a function as a tool in a chat, you need to craft the right call to tool(). This function helps you do that for documented functions by extracting the function's R documentation and creating a tool() call for you, using an LLM. It's meant to be used interactively while writing your code, not as part of your final code.

If the function has package documentation, that will be used. Otherwise, if the source code of the function can be automatically detected, then the comments immediately preceding the function are used (especially helpful if those are Roxygen comments). If neither are available, then just the function signature is used.

Note that this function is inherently imperfect. It can't handle all possible R functions, because not all parameters are suitable for use in a tool call (for example, because they're not serializable to simple JSON objects). The documentation might not specify the expected shape of arguments to the level of detail that would allow an exact JSON schema to be generated. Please be sure to review the generated code before using it!

## Usage

create\_tool\_def(topic, model = "gpt-4o", echo = interactive(), verbose = FALSE)

#### Arguments

topic	A symbol or string literal naming the function to create metadata for. Can also be an expression of the form pkg::fun.
model	The OpenAI model to use for generating the metadata. Defaults to "gpt-4o".
echo	Emit the registration code to the console. Defaults to TRUE in interactive sessions.
verbose	If TRUE, print the input we send to the LLM, which may be useful for debugging unexpectedly poor results.

#### Value

A register\_tool call that you can copy and paste into your code. Returned invisibly if echo is TRUE.

## Examples

```
## Not run:
    # These are all equivalent
    create_tool_def(rnorm)
    create_tool_def(stats::rnorm)
    create_tool_def("rnorm")
```

## End(Not run)

interpolate

Helpers for interpolating data into prompts

## Description

These functions are lightweight wrappers around glue that make it easier to interpolate dynamic data into a static prompt. Compared to glue, these functions expect you to wrap dynamic values in {{ }}, making it easier to include R code and JSON in your prompt.

## Usage

```
interpolate(prompt, ..., .envir = parent.frame())
```

interpolate\_file(path, ..., .envir = parent.frame())

## Arguments

prompt	A prompt string. You should not generally expose this to the end user, since glue interpolation makes it easy to run arbitrary code.
	Define additional temporary variables for substitution.
.envir	Environment to evaluate expressions in. Used when wrapping in another function. See vignette("wrappers", package = "glue") for more details.
path	A path to a prompt file (often a .md).

#### Value

A {glue} string.

#### Examples

joke <- "You're a cool dude who loves to make jokes. Tell me a joke about {{topic}}."

```
# You can supply valuese directly:
interpolate(joke, topic = "bananas")
# Or allow interpolate to find them in the current environment:
topic <- "applies"
interpolate(joke)
```

28

live\_console

## Description

- live\_console() lets you chat interactively in the console.
- live\_browser() lets you chat interactively in a browser.

Note that these functions will mutate the input chat object as you chat because your turns will be appended to the history.

#### Usage

```
live_console(chat, quiet = FALSE)
```

```
live_browser(chat, quiet = FALSE)
```

## Arguments

chat	A chat object created by chat_openai() or friends.
quiet	If TRUE, suppresses the initial message that explains how to use the console

#### Value

(Invisibly) The input chat.

#### Examples

```
## Not run:
chat <- chat_claude()
live_console(chat)
live_browser(chat)
```

## End(Not run)

Provider

A chatbot provider

# Description

A Provider captures the details of one chatbot service/API. This captures how the API works, not the details of the underlying large language model. Different providers might offer the same (open source) model behind a different API.

#### Usage

```
Provider(base_url = stop("Required"), extra_args = list())
```

#### Arguments

base_url	The base URL for the API.
extra_args	Arbitrary extra arguments to be included in the request body.

## Details

To add support for a new backend, you will need to subclass Provider (adding any additional fields that your provider needs) and then implement the various generics that control the behavior of each provider.

#### Value

An S7 Provider object.

#### Examples

Provider(base\_url = "https://cool-models.com")

token\_usage

Report on token usage in the current session

# Description

Call this function to find out the cumulative number of tokens that you have sent and recieved in the current session.

#### Usage

token\_usage()

#### Value

A data frame

# Examples

token\_usage()

tool

#### Description

Define an R function for use by a chatbot. The function will always be run in the current R instance. Learn more in vignette("tool-calling").

#### Usage

tool(.fun, .description, ..., .name = NULL)

#### Arguments

.fun	The function to be invoked when the tool is called.
.description	A detailed description of what the function does. Generally, the more informa- tion that you can provide here, the better.
	Name-type pairs that define the arguments accepted by the function. Each element should be created by a type_*() function.
.name	The name of the function.

## Value

An S7 ToolDef object.

#### Examples

```
# First define the metadata that the model uses to figure out when to
# call the tool
tool_rnorm <- tool(</pre>
  rnorm,
  "Drawn numbers from a random normal distribution",
  n = type_integer("The number of observations. Must be a positive integer."),
 mean = type_number("The mean value of the distribution."),
 sd = type_number("The standard deviation of the distribution. Must be a non-negative number.")
)
chat <- chat_openai()</pre>
# Then register it
chat$register_tool(tool_rnorm)
# Then ask a question that needs it.
chat$chat("
  Give me five numbers from a random normal distribution.
")
# Look at the chat history to see how tool calling works:
# Assistant sends a tool request which is evaluated locally and
```

# results are send back in a tool result.

Turn

### A user or assistant turn

## Description

Every conversation with a chatbot consists of pairs of user and assistant turns, corresponding to an HTTP request and response. These turns are represented by the Turn object, which contains a list of Contents representing the individual messages within the turn. These might be text, images, tool requests (assistant only), or tool responses (user only).

Note that a call to \$chat() and related functions may result in multiple user-assistant turn cycles. For example, if you have registered tools, ellmer will automatically handle the tool calling loop, which may result in any number of additional cycles. Learn more about tool calling in vignette("tool-calling").

## Usage

```
Turn(role, contents = list(), json = list(), tokens = c(0, 0))
```

## Arguments

role	Either "user", "assistant", or "system".
contents	A list of Content objects.
json	The serialized JSON corresponding to the underlying data of the turns. Currently only provided for assistant.
	This is useful if there's information returned by the provider that ellmer doesn't otherwise expose.
tokens	A numeric vector of length 2 representing the number of input and output tokens (respectively) used in this turn. Currently only recorded for assistant turns.

# Value

An S7 Turn object

#### Examples

```
Turn(role = "user", contents = list(ContentText("Hello, world!")))
```

# Description

These S7 classes are provided for use by package devlopers who are extending ellmer. In every day use, use type\_boolean() and friends.

## Usage

```
TypeBasic(description = NULL, required = TRUE, type = stop("Required"))
TypeEnum(description = NULL, required = TRUE, values = character(0))
TypeArray(description = NULL, required = TRUE, items = Type())
TypeObject(
   description = NULL,
   required = TRUE,
   properties = list(),
   additional_properties = TRUE
)
```

#### Arguments

description	The purpose of the component. This is used by the LLM to determine what values to pass to the tool or what values to extract in the structured data, so the more detail that you can provide here, the better.
required	Is the component required? If FALSE, and the component does not exist in the data, the LLM may hallucinate a value. Only applies when the element is nested inside of a type_object().
type	Basic type name. Must be one of boolean, integer, number, or string.
values	Character vector of permitted values.
items	The type of the array items. Can be created by any of the type_ function.
properties	Named list of properties stored inside the object. Each element should be an S7 Type object.'
additional_properties	
	Can the object have arbitrary additional properties that are not explicitly listed? Only supported by Claude.

#### Value

S7 objects inheriting from Type

#### Examples

```
TypeBasic(type = "boolean")
TypeArray(items = TypeBasic(type = "boolean"))
```

type\_boolean Type specifications

#### Description

These functions specify object types in a way that chatbots understand and are used for tool calling and structured data extraction. Their names are based on the JSON schema, which is what the APIs expect behind the scenes. The translation from R concepts to these types is fairly straightforward.

- type\_boolean(), type\_integer(), type\_number(), and type\_string() each represent scalars. These are equivalent to length-1 logical, integer, double, and character vectors (respectively).
- type\_enum() is equivalent to a length-1 factor; it is a string that can only take the specified values.
- type\_array() is equivalent to a vector in R. You can use it to represent an atomic vector: e.g. type\_array(items = type\_boolean()) is equivalent to a logical vector and type\_array(items = type\_string()) is equivalent to a character vector). You can also use it to represent a list of more complicated types where every element is the same type (R has no base equivalent to this), e.g. type\_array(items = type\_array(items = type\_string())) represents a list of character vectors.
- type\_object() is equivalent to a named list in R, but where every element must have the specified type. For example, type\_object(a = type\_string(), b = type\_array(type\_integer())) is equivalent to a list with an element called a that is a string and an element called b that is an integer vector.

#### Usage

```
type_boolean(description = NULL, required = TRUE)
type_integer(description = NULL, required = TRUE)
type_number(description = NULL, required = TRUE)
type_string(description = NULL, required = TRUE)
type_enum(description = NULL, values, required = TRUE)
type_array(description = NULL, items, required = TRUE)
type_object(
   .description = NULL,
   ...,
```

34

```
.required = TRUE,
.additional_properties = FALSE
)
```

#### Arguments

escription		
The purpose of the component. This is used by the LLM to determine what values to pass to the tool or what values to extract in the structured data, so the more detail that you can provide here, the better.		
required, .required		
Is the component required? If FALSE, and the component does not exist in the data, the LLM may hallucinate a value. Only applies when the element is nested inside of a type_object().		
Character vector of permitted values.		
The type of the array items. Can be created by any of the type_ function.		
Name-type pairs defineing the components that the object must possess.		
.additional_properties		
Can the object have arbitrary additional properties that are not explicitly listed? Only supported by Claude.		

#### Examples

```
# An integer vector
type_array(items = type_integer())
# The closest equivalent to a data frame is an array of objects
type_array(items = type_object(
    x = type_boolean(),
    y = type_string(),
    z = type_number()
))
# There's no specific type for dates, but you use a string with the
# requested format in the description (it's not gauranteed that you'll
# get this format back, but you should most of the time)
type_string("The creation date, in YYYY-MM-DD format.")
```

```
type_string("The update date, in dd/mm/yyyy format.")
```
